Key Features

Motor Bus Transfer Protection

Because industrial facilities with critical processes require a reliable supply of electric power, they typically have two incoming sources. To ensure process continuity during a fault to the primary feeder, the SEL-700BT Motor Bus Transfer Relay quickly and safely transfers loads to an auxiliary feeder via one of four transfer methods: fast, in-phase, residual, or fixed-time. This instantaneous transfer of load keeps processes running without requiring a cold start, helps avoid costly shutdowns, provides personnel safety, and helps avoid environmental damage. Manual load transfer is also possible locally or remotely via communications.

Comprehensive System Protection

Protect equipment using phase, negative-sequence, residual-ground, and neutral-ground overcurrent elements with directional control. You can also apply phase, negative-sequence, residual-ground, and neutral-ground time-overcurrent elements. The SEL-700BT includes many advanced protection features that ensure secure and reliable operation, such as synchronism check and rate-of-change-of-frequency (ROCOF) controls.

Easy Communications

Choose from single or dual copper or fiber-optic Ethernet ports, serial communications, and several protocols, including MIRRORING BITS communications, IEC 61850 Edition 2, EtherNet/IP, the software-based IEEE 1588 Precision Time Protocol (PTP), IEC 60870-5-103, and the Parallel Redundancy Protocol (PRP). Multiple Modbus

TCP or Modbus serial sessions are available for custom configuration of your application. You can also use DNP3 serial or DNP3 LAN/WAN protocols. In addition, the IEC 61850 test mode enables in-service testing, which reduces commissioning time.

Breaker Wear Monitoring

Record accumulated breaker contact wear with the breaker monitor function, which uses the breaker manufacturer's specifications for defining operation limits. The internal monitor tracks the total number of close/open operations and integrates the interrupted current per phase. You can set an alarm to alert operators when measured and accumulated quantities approach maintenance thresholds. This information facilitates proactive breaker maintenance and replacement.

Reliable, Rugged Hardware

The SEL-700BT operates in extreme conditions, with an operating temperature range of -40° to $+85^{\circ}\text{C}$ (-40° to $+185^{\circ}\text{F}$). It withstands vibration, electrical surges, fast transients, and extreme temperatures, meeting stringent industry standards. A conformal-coating option for the printed circuit boards provides an additional barrier against airborne contaminants, such as hydrogen sulfide, chlorine, salt, and moisture. In addition, the SEL-700BT is ATEX-certified and Underwriters Laboratories (UL) Class I, Division 2-certified for use in hazardous and potentially explosive environments.

With the bay screen, you can control multiple breakers and disconnects, initiate source transfers, and control the bus transfer scheme.

Breaker Control

To control a breaker, simply tap the bay screens application on the home screen and then the breaker you want to control. When asked to confirm the action, choose Yes to complete the action.

Applications

Motor Bus Transfer Solution

The SEL-700BT has built-in logic for motor bus transfer, which allows for the instantaneous transfer of load to an auxiliary feeder from the primary feeder during faults to the primary feeder. Manual load transfer is also possible locally or remotely via communications. The four automatic bus transfer methods available include:

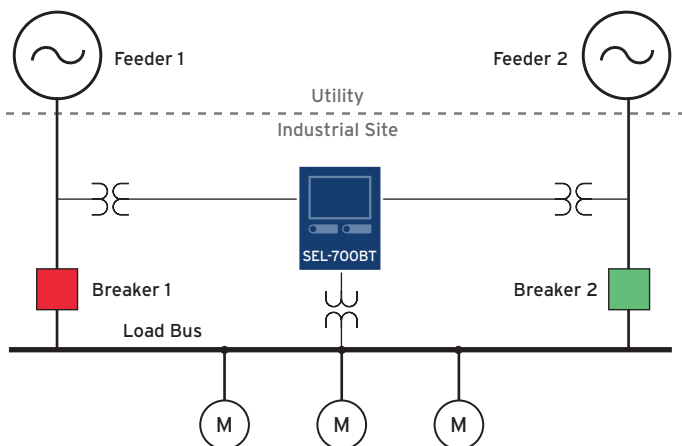

- Fast, in which the transfer occurs shortly after the first breaker opens and before the phase of the residual voltage deviates from the system.

- In-phase, which occurs when the phase of the system voltage and the residual voltage align.
- Residual, in which the relay waits for the residual voltage to fall below a certain threshold before transferring the bus.
- Fixed-time, which is configurable via SELogic control equations.

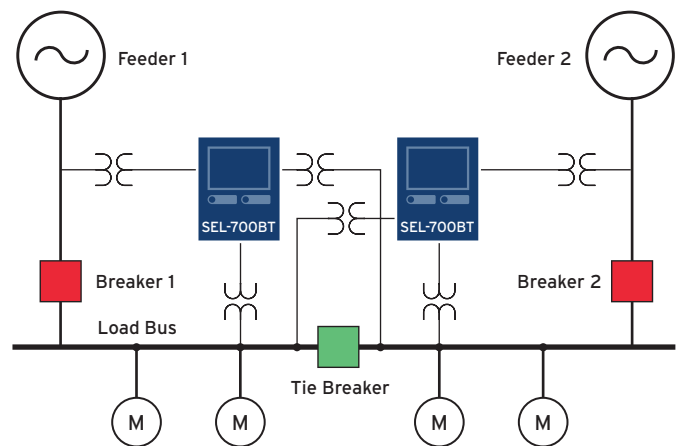

Main-Main Configuration

A single SEL-700BT can protect and control a critical main-main load bus by selecting from two sources automatically.

Main-Tie-Main Configuration

Two SEL-700BT relays (one on each side of the inertia) are used to transfer the load bus between sources in a main-tie-main configuration. This allows the system to retain load diversity during normal operation and enables advanced transfer functions.

Complete Overcurrent Protection

Apply instantaneous and directional instantaneous overcurrent and time-overcurrent protection with as many as two sets of three-phase CTs and one neutral CT input. Phase overcurrent protection is provided for both three-phase inputs.

RTD-Based Thermal Protection

Acquire thermal data for alarm, monitoring, and trip functions in the SEL-700BT with a 10 RTD input card or an external 12 RTD SEL-2600 RTD Module.

Synchronism Check

The built-in synchronism-check function provides supervision on both the X side and the Y side for the acceptable voltage window and maximum percentage difference, maximum and minimum allowable slip frequency, target closing angle, and breaker closing delay. The tie synchronism-check function provides the closing window for the bus-tie breaker when connecting to a utility system.

Use SEL-5601-2 SYNCHROWAVE® Event Software to Retrieve and Display Event Reports Recorded by the SEL-700BT

With SYNCHROWAVE Event, you can:

- Display event report oscillograms. You can view each report as a plot of magnitude versus time and select analog and digital points to build a custom display.
- Display phase and symmetrical component phasors. Displaying the phasor view of electrical data helps you better understand asymmetrical, three-phase faults. You can build a custom plot using per-phase and symmetrical component sequence currents and voltages.
- Retrieve event reports using serial or Ethernet communications links.

Retrofit Replacement Kits

Easily replace existing motor bus transfer protection with the SEL-700BT and the applicable mounting kit. These kits provide everything needed to replace many existing relays with the SEL-700BT. No cutting or drilling is required when you use the optional mounting kits. Replacement of existing protection is quick and easy.
